JAPANESE BLACK PINES

The best tall evergreen for seaside planting

JAPANESE BLACK PINES

This variety of pine has been a specialty of ours for many years — ever since we were convinced of its superiority as a seaside tree.

Our trees have been successfully planted not only here on our New England Coast but also along the Atlantic seaboard as far as South Carolina. Many huge truckloads have been delivered to Long Island alone.

The fact that the trees have succeeded is borne out from the numerous letters from our customers and the many repeat orders received from them. The Commonwealth of Massachusetts in February 1959 placed a contract for planting among numerous other items along a state highway on Cape Cod, a single order for 4,500 4 year transplants of Japanese Black Pines.

Hundreds of trees from 3 feet to 6 feet or more in height, individually dug with a ball of earth and burlapped, have been delivered to our customers each year.

SMALL ECONOMY SIZE

When you consider that an average Japanese Black Pine only 2 to 3 feet tall dug with a ball of earth weighs approximately 50 pounds, you will realize that the transportation cost for those living at a distance is considerable. Because of this many people prefer to plant smaller trees that can be safely handled without a ball of earth. These are shipped by parcel post, their roots wrapped in moist moss, at a much lower transportation cost.

These transplants are particularly practical for planting by those who live in somewhat out-of-the-way places such as Monhegan Island, Maine, Cuttyhunk, Mass., Block Island, R. I., Fire Island, N. Y. and numerous places along the New Jersey and Virginia Coast.

Because of the demand for these trees in smaller sizes, yet large enough to plant where they are to grow permanently, see our special spring offer.

A GOOD ROOT SYSTEM

Transplanting helps to develop a heavy, compact root system that enables the plant to become more quickly established than a seedling that has not been transplanted. We strongly urge you to plant transplanted trees for quickest results.

A question that we are asked repeatedly is "Can we plant these trees and shrubs in clear sand?" The answer is "No". Peat moss should be mixed with the sand. One part peat to two or three parts of soil is about the right proportion depending on how sandy your soil is. Add a little properly balanced plant food after planting. Firm the soil around the roots so that the trees or shrubs are well anchored and soak thoroughly.

Specimens of Japanese Black Pines planted at a seaside home at Wianno, Cape Cod.

RAPID GROWTH

These Pines, when established, will grow up to 18 inches per year. A four year old transplant after it has had one season to become established, will grow more in one year than it did in the first four years of its life. In a few years you should have beautiful specimen trees, 5 to 8 feet or more in height, similar to the tree in this picture.

LANDSCAPE WITH PINES

If you have a home at the seashore, either summer or year-round, you will enjoy the charm of the Japanese Black Pines.

They are ideal for windbreaks and screens, as shown above, near steamer wharf at Nantucket adding privacy to your yard as well as hiding objectionable views — but however used will add beauty and character to your setting.

SPECIAL SPRING OFFERS

JAPANESE BLACK PINES — 4 Years Old

These have been transplanted from the propagating beds to nursery rows — healthy young trees with a good root system.

PRICES —

4 year old trees
transplanted once — 8 to 12 inches tall
10 for \$10.00
25 for 22.50
100 for 80.00

We prepay transportation when remittance accompanies order.

These Japanese Black Pines at Barrington, R. I., were completely covered with salt water during the hurricane of 1954 — yet were unharmed.

Horticultural authorities agree that these trees are the best for withstanding salt spray and violent winds.

JAPANESE BLACK PINES — 5 Years Old

Transplanted twice — 12 to 15 inches tall

PRICES —

10 for \$ 15.00
25 for 33.75
100 for 120.00

We also have a more limited quantity — 5 year — transplanted twice — 15 to 24 inches tall —

10 for \$20.00
25 for 45.00

These will also be shipped prepaid when remittance accompanies order.

JAPANESE BLACK PINES

In larger sizes — individually balled and burlapped (B&B).

2 to 3 ft. B&B
\$ 7.50 each, 10 or more \$ 6.75 each
3 to 4 ft. B&B
10.00 each, 10 or more 9.00 each
4 to 5 ft. B&B
15.00 each, 10 or more 13.50 each

These prices are at our nurseries. Add 20% if they are to be crated for shipment by common carriers.

NOTE — Our prices have not advanced on these during the past 6 years.

These larger sizes are for those within an easy delivering distance of our nurseries or can be shipped by our truck in combinations with other shipments to the same area if in Massachusetts, Rhode Island, or along the Connecticut shore line.

Order today — plant as early as you can and get the benefit of spring rains. It is not practical to ship or plant these after the new growth has started in late May.

SEEDLINGS

Some patient people with green thumbs may want to try planting some 2 year old seedlings. In size they are approximately as big as a lead pencil.

These have not been transplanted and therefore do not have as good a root system as those that have been transplanted.

The best way to handle these 2 year olds is to plant them in beds where they can be shaded for a while and watered when needed. After two or three years they can be planted where they are to remain permanently.

We suggest and earnestly recommend that you buy 4 or 5 year old transplants but we can supply 2 year old seedlings at the following prices:

10 for \$3.00	25 for \$6.50
---------------	---------------

Shipped prepaid when remittance accompanies order.

On two occasions in September, 1954, salt water was ten feet over these Rugosa Roses. This picture was taken one year later.

AUTUMN ELAEAGNUS

— *Elaeagnus umbellata*

This is one of the best large shrubs for planting in areas where they will be subjected to strong winds and salt spray. The shrub is a cousin to the Russian Olive, equally vigorous growing, but of broader habit — fragrant flowers, too! Its fruit is produced in abundance, — small silver and amber berries finally turning red. The fruit persists late in the season after most other berries have dropped. For that reason, it is a fine food for birds such as quail, pheasant and partridge. The leaves, silver underneath, add a sparkle to the landscape.

2 to 3 ft.	\$3.00 each
3 to 4 ft.	4.00 each
4 to 5 ft.	5.00 each

BEACH PLUM — *Prunus maritima*

“Cape Cod Jelly Bush” perhaps would be an appropriate name for this salty native that grows along our coast, right down to the high water mark, bothered not a bit by gales and storms.

Visitors to the Cape always remember the jars of bright-colored jelly displayed for sale on tables in the front yards of the native Cape Codders. And if you’ve ever tasted the tart jelly, with a flavor all its own, you’ll surely never forget the Beach Plum.

It has a place in a home planting, too, — a spreading, not-too-tall shrub that is a mass of white in May.

18 to 24 inch plants	\$2.00 each
2 to 3 feet	\$3.00 each

MEMORIAL ROSE — *Rosa wichuraiana*

An effective cover-all for banks and other bare and unsightly places. Spreads rapidly, rooting where it touches soil. Very hardy. Fragrant, starry white flower clusters. Bright red berries later. Plant 2 feet apart.

\$1.50 each	10 for \$13.50
-------------	----------------

The special prices include transportation prepaid on Japanese Black Pine transplants and Rosa rugosa only. The other shrubs will be sent transportation collect.

RUGOSA ROSE — *Rosa rugosa*

This rose has long been recognized as one of the best shrubs for planting close by the sea, even where the winds bring salt spray from the tossing waves. It is excellent for group plantings and will make a thick colorful hedge or screen that requires a minimum of labor.

During the Summer it has clusters of large rose-pink single flowers against a background of rich green leaves, and later conspicuous red fruits that give it color throughout the Fall.

12 to 18 in.	\$1.50 each	10 for \$13.50
18 to 24 in.	1.75 each	10 for 16.00
2 to 2½ ft.	2.25 each	10 for 20.00

We pay the transportation when remittance accompanies order.

SPREADING COTONEASTER

— *Cotoneaster divaricata*

The Spreading Cotoneaster has myriads of small pinkish flowers in early June. Its foliage throughout the Summer appears evergreen (which it is not) and in the Autumn it is plastered with quantities of bright red berries. It is neither upright in growth, like a Rose of Sharon, nor prostrate, like the Rock Cotoneaster (*Cotoneaster horizontalis*), but is intermediate. In the Winter months its low arching branches provide an attractive form.

18 to 24 in.	\$3.00 each
2 to 3 ft.	4.00 each
3 to 4 ft.	5.00 each

RUSSIAN OLIVE — *Elaeagnus angustifolia*

Here is a truly great shrub for planting near the salt water. It is one of the taller-growing types with attractive gray-green foliage. The clusters of small reddish berries (edible if you care for them) are interesting in the Fall.

Plant Russian Olives for a background or as a wind-break. At the shore plant them closer together than you would in inland sheltered spots.

They are fairly rapid growing and are just the thing to use in a group to grow up quickly and screen anything you would like to hide (such as your neighbor’s back door). They’ll get you privacy — but fast!

2 to 3 ft.	\$2.00 each
3 to 4 ft.	2.50 each

WARMINSTER BROOM — *Cytisus praecox*

The pale yellow flowers of this variety suit us a lot better than the mustard-yellow flowers of the common Scotch Broom. The brilliance of this shrub when in bloom catches everyone’s eye and when we first exhibited one at the Spring Flower Show it caused more “Oh’s” and “Ah’s” than any other plant. Striking in the Winter, too, with its bright green branches. And it’s as much at home at the waters edge as a flock of peeps.

15 to 18 in.	\$2.00 each
Container grown
